

“Machine Learning: Living in the Age of AI | A WIRED Film”

Reaction Paper

When I first saw the title “Machine Learning: Living in the Age of AI” I thought, “This is going to be some boring robot talk.” But I was wrong. After watching it, I found it really interesting. This film by WIRED shows how machine learning and AI are part of everyday life. It talks about how people like students, farmers, and older adults are using AI. The film shows that AI is not just for experts or in science fiction, it’s in our phones, farms, hospitals, and even cars. AI is everywhere now. There are talking robots, self-driving cars, drones that help farmers, and apps that help blind people see just by using their phone. There’s even a smart kid who used AI to help cure pancreatic cancer.

One part that really hit me was about how AI is used in farming. There is a drone flying over fields, checking crops, and helping farmers make better decisions. That made me think about my own family. My family are farmers, and it’s been tough lately. It’s getting harder to monitor all the crops, especially with bad weather and sneaky pests. Walking through rows of plants is tiring, and sometimes we miss problems because we just can’t see everything at once. But this film showed AI can help farmers by using smart drones to keep an eye on crops.

Some of the coolest things in the video were how AI can diagnose diseases faster than doctors, help blind people see, and even help to find cure for cancer. These examples show AI’s huge potential to positively impact society by improving health, safety, and productivity. I thought it was inspiring to see how AI can be more than just machines, it can actually save lives and solve problems.

The film also talks about the future. AI won’t take over everything, but it will work with people. Still, there are problems to think about, like keeping data private, making fair choices, and people losing their jobs. The important thing is to use AI in a good way, to help people and bring out their creativity. The film helped me see that AI is just a tool and like any tool, it depends on how we use it.

We need to find a balance between the good and bad sides of AI. That means making clear rules and fair systems. We should also make sure AI is not used to hurt people and more people need to learn about AI so they can use it safely.

Watching this film made me think two things: “AI is really cool,” and “A robot might take my job one day.” At first, I was scared that AI could take over everything. But now I see it can actually help us. This film made me think a lot and left me with many questions. But more than anything, it made me curious about AI. It’s not just some robot takeover it’s a tool that, if used the right way, can make our lives better.
